What is Nive Notis?

With the Nive Notis mobile application you can easily, securely and instantly report important observations and reports including included location data from the observation site directly to the company's information management system, where the information is immediately ready for further processing.

How does it work?

Every application user needs an active M-Files-license. The app is available for all iOS- and Android devices.

The user interface of the application, the types of observation and the data to be collected can be configured directly in the client's M-Files Admin tool.

The user can attach pictures and/or videos to improve the quality of the observation.

Automatic GPS-coordinates and address information can be added to the observation if necessary. The user can also set the location manually.

Example use case
